

S24-3 Education in united graduate school of pharmaceutical science at city university

○Hiroichi NAGAI¹

¹Gifu Pharmaceutical University

During this decade, Japanese Ministry of Education, Culture, Sports, Science and Technology proposed several programs for graduate school education to facilitate the research activities and international academic project at Japanese universities. Some of these programs are successful but they are not always suitable for the education in some kinds of university such as the college educating only one special field. In this presentation, our trials to encourage the graduate school education under our limited circumstances will be introduced. One trial is the cooperation for the establishment of united graduate school of life science at Gifu University. And the other one is the participation in the collaborating graduate school with the prefectural institutes. These two programs are effective to progress the research and education in our graduate school and give an opportunity to the students to study more wide related sciences. The feature education in graduate school of pharmaceutical science based on our experience will be discussed.
