

How to use medical and drug information? The view of integrated information's handling.

○ Hayato Toyotama (Japan Medical Abstracts Society)

What kind of systems does we need? Anybody can get herbs, herbal medicines and dietary supplements from abroad. It became easily to anybody except apart of drugs and foods like this. But there are no administration systems to maintain drug safety. Because it is very difficult to construct system maintain drugs and foods safety. Adding to systems including national welfare and political systems.

Recently anybody can get these drugs and food through Internet. But all of them are not well known its safety. If there are well known people, it is a few, not so many. Therefore I think we need sophisticated system anybody can get drugs and foods safety. Of course, national welfare and political systems are included.

How about database and systems provide drugs safety and side effect? Many doctors, nurses, pharmacies and co-medicals use these databases. On the other hands, non-medicals also used. Quasi Drugs too.

It will be better for anybody to protect harmful dietary supplements, herbs and herbal medicines. I reconsider these problems in point of medical information provider.
