---

A new district health plan started in April, 2008. Under this new plan, district health care system is largely changed and should be formed in following four diseases such as cancer ,stroke ,diabetes and acute myocardial disease.

A special point in a new district health plan is that district pharmacies are defined as "health care facilities". By this definition, the district pharmacy has to play the role as providing center of the drug and the hygienic good corresponding for four diseases.

In the lecture we will mention about the new roles of pharmacists as follows; contributions to district referral critical-pathway , home health care and pre-discharge conference in acute care hospital.
